Adult Breathing systems for Transport Ventilators
Intersurgical now offers a range of disposable adult transport breathing systems for use with the majority of transport ventilators for inter departmental and inter hospital patient transport or transfer. The breathing systems have now been set up ready for use, straight from the pack.

The systems use a selection of valves and flow sensors that have been designed and validated for the appropriate ventilators as shown in this information sheet.

The Oxylog 3000/3000 plus systems also feature an over moulded connector block for the flow sensor lines, ensuring secure connection and correct orientation of the two lines.
